

NOWPAP-PICES Joint Training Course on Remote Sensing Data Analysis

Yu Heng Lu

1st year PhD student

Agricultural and Life Sciences

the University of Tokyo

NOWPAP-PICES Joint Training Course on Remote Sensing Data Analysis was held in China on October 21-25, and it was the first time I attended the international training course. It was an unforgettable experience for me.

Firstly, the training course was useful for me. Before this training course I just knew a little about remote sensing, but I have no idea about how to use the software to get the graphs. However, soon after the hands-on exercises, I can get graphs of time series of ocean by processing software. Although I had not thought of using remote sensing data for my study, after the training course I started thinking how to combine my study with the remote sensing data.

Secondly, we also learned a lot about the cultures during to our different backgrounds, experiences, and researches in free time. Everyone at the training course was very kind and after the training course, we still keep in touch through internet communication. At this moment we are students, but one day when we become the scientists or government officers, the international collaboration may be held.

In the end, this was a very good training course. I would like to thank all speakers, organizers and participants for organizing such a valuable course and giving me this great opportunity.
